

**AMENDED CLAIM SET:**

1. (currently amended) A high-density detergent composition comprising 10 to 60% by weight of a surfactant composition having a weight ratio of an anionic surfactant to a nonionic surfactant of 4:10 or more and 10:0 or less,

wherein said surfactant composition comprises an alkali metal silicate and also comprises and 15% or less by weight of sodium carbonate, and wherein a total sum of the sodium carbonate and the alkali metal silicate is 19% or more by weight of the detergent composition, a water-soluble inorganic salt,

wherein the high-density detergent composition has a bulk density of from 600 to 1200 g/L, and has a total summation of a product of a mass base frequency  $W_i$  and a dissolving rate  $V_i$  of each group of classified granules obtained by classifying detergent granules by using a classifier, which satisfies the following formula (A):

$$\Sigma(W_i \cdot V_i) \geq 95(\%) \quad (A)$$

and wherein a mass base frequency of the classified granules having a size of less than 125  $\mu$  is 0.1 or less, wherein the classifier comprises a series of sieves having sieve-openings respectively of 2000  $\mu$ m, 1410  $\mu$ m, 1000  $\mu$ m, 710  $\mu$ m, 500  $\mu$ m, 355  $\mu$ m, 250  $\mu$ m, 180  $\mu$ m, and 125  $\mu$ m, and a receiver, and the dissolving rate  $V_i$  the dissolving rate  $V_i$  is determined under the following measurement conditions:

supplying 1.000 g  $\pm$  0.010 g of a sample to 1.00 L  $\pm$  0.03 L of water at 5°C  $\pm$  0.5°C having a water hardness of 4°DH, stirring in a 1 L beaker of which inner diameter is 105 mm, with a cylindrical stirring rod of which length is 35 mm and diameter is 8 mm, at a rotational speed of 800 rpm for 120 seconds, and thereafter filtering insoluble remnants by a standard sieve having a sieve-opening of 300  $\mu$ m as defined according to JIS Z 8801, wherein the dissolving rate  $V_i$  of the classified granules is calculated by the following formula (a),  $i$  being each group of the classified granules:

$$V_i = (1 - T_i / S_i) \times 100(\%) \quad (a)$$

wherein  $S_i$  is a weight (g) of each group of the classified granules supplied; and  $T_i$  is a dry weight (g) of the insoluble remnants of each group of the classified granules remaining on the sieve after filtration.

2. (currently amended) A high-density detergent composition comprising 10 to 60% by weight of a surfactant composition having a weight ratio of an anionic surfactant to a nonionic surfactant of 0:10 or more and less than 4:10 and 15% or less,

wherein said surfactant composition comprises an alkali metal silicate and also comprises and 15% or less by weight of sodium carbonate, and wherein a total sum of the sodium carbonate and the alkali metal silicate is 19% or more by weight of the detergent composition, a water soluble inorganic salt,

the detergent composition having a bulk density of from 600 to 1200 g/L, wherein the high-density detergent composition has a total summation of a product of a mass base frequency  $W_i$  of each group of classified granules and a dissolving rate  $V_i$  of each group of the classified granules, which satisfies the following formula (B):

$$\Sigma(W_i \cdot V_i) \geq 97(\%) \quad (B)$$

and wherein a mass base frequency of the classified granules having a size of less than 125  $\mu$  is 0.08 or less, wherein the classifier comprises a series of sieves having sieve-openings respectively of 2000  $\mu$ m, 1410  $\mu$ m, 1000  $\mu$ m, 710  $\mu$ m, 500  $\mu$ m, 355  $\mu$ m, 250  $\mu$ m, 180  $\mu$ m, and 125  $\mu$ m, and a receiver, and the dissolving rate  $V_i$  the dissolving rate  $V_i$  is determined under the following measurement conditions:

supplying 1.000 g  $\pm$  0.010 g of a sample to 1.00 L  $\pm$  0.03 L of water at 5°C  $\pm$  0.5°C having a water hardness of 4°DH, stirring in a 1 L beaker of which inner diameter is 105 mm, with a cylindrical stirring rod of which length is 35 mm and diameter is 8 mm, at a rotational speed of 800 rpm for 120 seconds, and

thereafter filtering insoluble remnants by a standard sieve having a sieve-opening of 300  $\mu\text{m}$  as defined according to JIS Z 8801, wherein the dissolving rate  $V_i$  of the classified granules is calculated by the following formula (a),  $i$  being each group of the classified granules:

$$V_i = (1 - T_i / S_i) \times 100(\%) \quad (a)$$

wherein  $S_i$  is a weight (g) of each group of the classified granules supplied; and  $T_i$  is a dry weight (g) of the insoluble remnants of each group of the classified granules remaining on the sieve after filtration.

3. (original) A process for preparing the high-density detergent composition of claim 1, comprising subjecting unclassified detergent granules comprising 10 to 60% by weight of a surfactant composition to classification operation; and adjusting a particle size of each group of the resulting classified granules, such that the formula (A) as defined in claim 1 is satisfied, and that a mass based frequency of the classified granules having a size of less than 125  $\mu\text{m}$  is 0.1 or less.

4. (original) A process for preparing the high-density detergent composition of claim 2, comprising subjecting unclassified detergent granules comprising 10 to 60% by weight of a surfactant composition to classification operation; and adjusting a particle size of each group of the resulting classified granules, such that the formula (B) as defined in claim 2 is satisfied, and that a mass based frequency of the classified granules having a size of less than 125  $\mu\text{m}$  is 0.08 or less.

5. (previously presented) A high-density detergent composition as in claim 1 or claim 2, wherein the counterions in said anionic surfactant comprise 5% by weight or more potassium counterions.

6. (previously presented) A high-density detergent composition as in claim 5, wherein said anionic surfactant comprises 1 to 50% by weight of said detergent composition.

7. (previously presented) A high-density detergent composition as in claim 6, wherein said anionic surfactant comprises 5 to 30% by weight of said detergent composition.

8. (previously presented) A high-density detergent composition as in claim 1 or claim 2, wherein said nonionic surfactant is a polyoxyethylene-polyoxypropylene-polyoxyethylene alkyl ether.

9. – 11. (cancelled).
